# First-in-Human Study of Hypoxia-Inducible Factor-Prolyl Hydroxylase Inhibitor (HIF-PHI)

# AND017 in Healthy Participants

Yusha Zhu<sup>1</sup>, Ping Du<sup>1</sup>, Qi Zhu<sup>1</sup>

<sup>1</sup>Kind Pharmaceuticals LLC, Redwood City, CA, USA

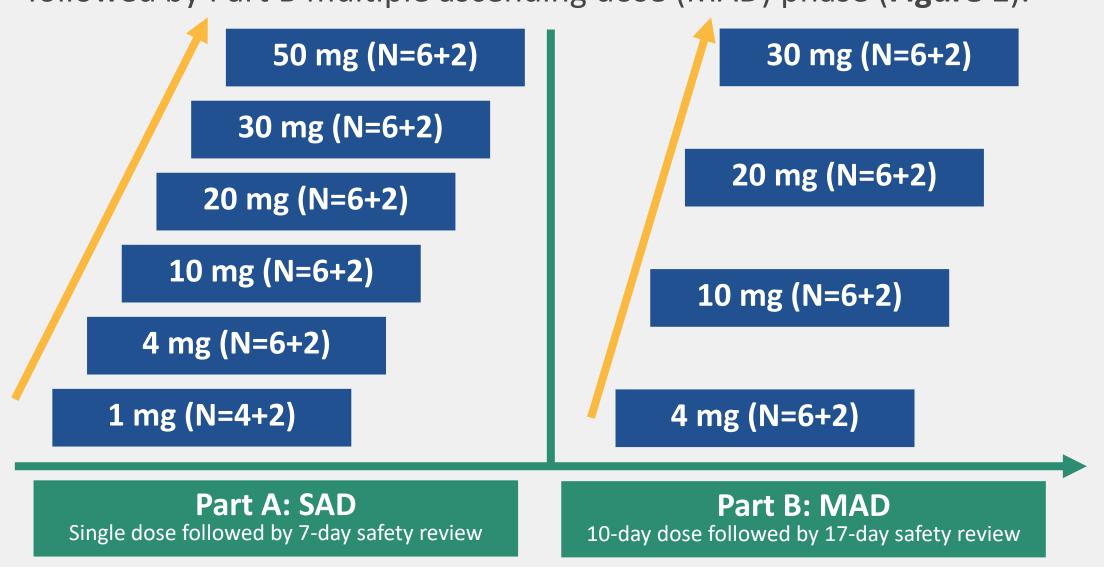

# BACKGROUND

- AND017 is a novel hypoxia-inducible factor-prolyl hydroxylase inhibitor (HIF-PHI) administered orally for treatment of patients with anemia due to chronic kidney disease (CKD).
- This phase I clinical trial was conducted in Australia to evaluate the pharmacokinetics (PKs), pharmacodynamics (PDs) and safety of AND017 among healthy subjects. (NCT04751539)

# METHODS

#### Study Design

- Phase I, randomized, double-blinded, placebo-controlled study
- The study consisted of two parts: Part A single ascending dose (SAD) phase, followed by Part B multiple ascending dose (MAD) phase (Figure 1).

N=x+y, x- AND017, y- placebo; SAD – Single ascending dose; MAD – Multiple ascending dose;

#### Figure 1. Study Design

#### Subjects

Healthy male and female, age 18-45 years

# Primary Objective

To evaluate the safety and tolerability of AND017 following single and multiple oral doses

### Secondary and Exploratory Objective

- To characterize the PKs of AND017 in plasma
- To evaluate the PD response of AND017

# RESULTS

#### Disposition and Demographics

- A total of 78 subjects were enrolled with 46 in Part A SAD phase and 32 in Part B
  MAD phase.
- All subjects were included in the PD and safety analysis set; all 58 subjects received AND017 were included in the PK analysis set.
- Subjects in all treatment groups were of similar demographics and baseline characteristics. In Part A, the mean age was 25.2 years, and 41.3% was female; in part B, the mean age was 29.7 years and 50% was female.

### RESULTS

#### Safety Analysis

- In Part A, 15 subjects (32.6%) experienced treatment-emergent adverse events (TEAEs), among which 12 subjects were dosed with AND017 (35.3%) (**Table 1**).
- The frequently reported TEAEs (>5%) in the pooled AND017 group were dizziness (14.7%), fatigue (11.8%), and headache (8.8%) (**Table 1**).

**Table 1. Summary of TEAEs in Part A SAD Phase** 

| Adverse Events<br>n (%) | Pooled AND017<br>N=34 | Placebo<br>N=12 |
|-------------------------|-----------------------|-----------------|
| Any TEAE                | 12 (35.3%)            | 3 (25.0%)       |
| Dizziness               | 5 (14.7%)             | 0               |
| Fatigue                 | 4 (11.8%)             | 1 (8.3%)        |
| Headache                | 3 (8.8%)              | 0               |
| Constipation            | 1 (2.9%)              | 0               |
| Flatulence              | 1 (2.9%)              | 0               |
| Tongue discomfort       | 1 (2.9%)              | 0               |
| Cough                   | 1 (2.9%)              | 0               |
| Dyspnea                 | 1 (2.9%)              | 0               |
| Neck pain               | 1 (2.9%)              | 0               |
| Rash                    | 1 (2.9%)              | 0               |
| Toothache               | 0                     | 1 (8.3%)        |
| Nasal congestion        | 0                     | 1 (8.3%)        |
| Oropharyngeal pain      | 0                     | 1 (8.3%)        |

- In Part B, 16 subjects (50.0%) experienced TEAEs, among which 10 subjects were dosed with AND017 (41.7%) (**Table 2**).
- The most frequently reported AE (>5%) in the pooled AND017 group was headache (12.5%) (**Table 2**).
- No SAEs, deaths, or AEs leading to discontinuation in both study parts.

Table 2 Summary of TFΔFs in Part R MΔD Phase

| Adverse Events        |                       |                |  |  |
|-----------------------|-----------------------|----------------|--|--|
| Adverse Events n (%)  | Pooled AND017<br>N=24 | Placebo<br>N=8 |  |  |
| Any TEAE              | 10 (41.7%)            | 6 (75.0%)      |  |  |
| Headache              | 3 (12.5%)             | 2 (25.0%)      |  |  |
| Dysmenorrhea          | 1 (4.2%)              | 2 (25.0%)      |  |  |

| Diarrhea              | 0                     | 1 (12.5%)      |  |  |
| Chest pain            | 0                     | 1 (12.5%)      |  |  |

#### PK Analysis

- The PK profiles in Part A and Part B were comparable.
- There was no tendency toward a change in T<sub>max</sub>, half-life, volume of distribution, and clearance across the dose range investigated in the SAD and MAD phases (Table 3-5).
- The median T<sub>max</sub> ranged from 2.0-4.5 h and the mean half-life ranged from 10.1-19.7 h after single and multiple dose administration (**Table 3-5**).

- PK analysis in Part B MAD phase showed that AND017 plasma concentration reached steady state on Day 6 after once-daily dosing.
- There was an approximate 1.2-1.6-fold accumulation after 10 consecutive days of administration.
- Dose proportionality was confirmed with the regression slope close to 1, indicating a proportional increase in exposure across the investigated dose range.

#### PD Analysis

- The PD parameters of EPO in Part A SAD phase, on Day 1 and Day 10 in the Part B MAD phase showed obvious dose dependence.
- In Part A SAD phase, EPO levels showed a marked increase from baseline at 6 h post-dose in the AND017 20 mg, 30 mg, and 50 mg groups, with a peak observed around 12 h post-dose.
- In Part B MAD phase, EPO showed an obvious increase from baseline at 6 h post-dose in the AND017 high dose groups (20 mg and 30 mg) (**Figure 2**).
- In the PK/PD relationship analysis, the increases in EPO parameters were significantly associated with AND017 PK exposures.

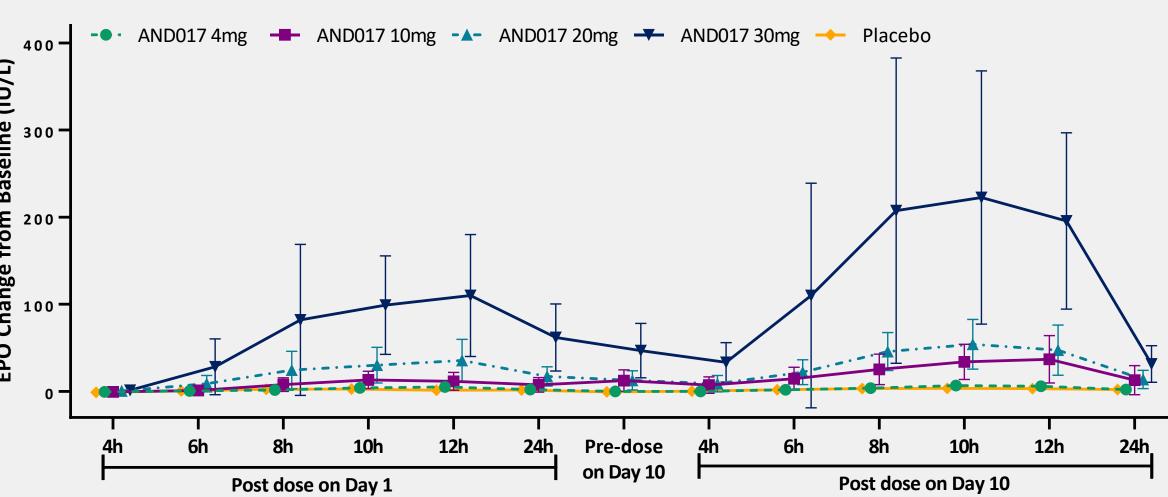

Figure 2. Line Plot of Change from Baseline in EPO in Part B MAD Phase

- The PD parameter Hb was assessed in Part B MAD phase. High dose levels of AND017 (20 mg and 30 mg) showed greater mean of change from baseline in Hb levels (**Figure 3**).
- Similar results were observed in the PD parameters red blood cell and absolute reticulocyte count.

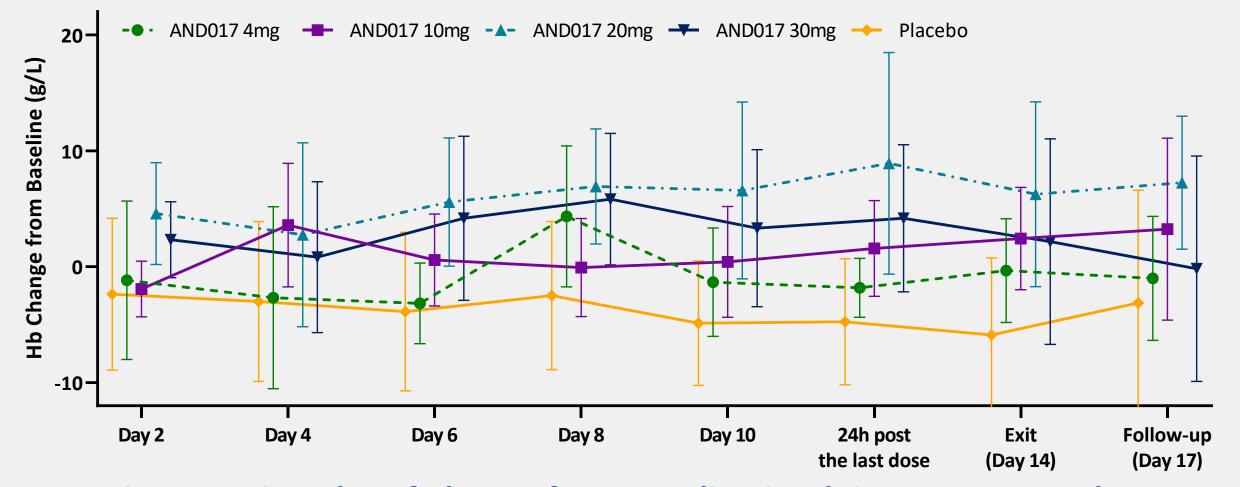

Figure 3. Line Plot of Change from Baseline in Hb in Part B MAD Phase

# CONCLUSION

AND017 was safe and well tolerated in healthy adult subjects at single oral doses ranging from 1 mg to 50 mg, as well as at multiple doses of 4 mg to 30 mg administered over 10 consecutive days.
